■Features:Deals high torque and has significantly few backlash because the spacer is assembled by press-fitting.
Excellent for carrier device using servo motor, since the full length is short and spacer absorbs the shock at forward reverse action.

(?) Operating Temperature -20ºC~60ºC
(?) d1, d2 tolerance are values before slit machining.
(?) The lateral, angular, and axial misalignment values shown are for each occurring separately alone.
If more than one misalignment are occurring simultaneously, allowable value will be reduced to 1/2 each.
(?) For the selection criteria and alignment procedures, see **P.961**
(?) A separation of hub is possible by fitting commercially available bolt into the separating screw hole.

■Features (CPF)

The torque is conveyed by the serrations engagement on the sleeve. A flexible coupling with a simple structure.
Excellent in flexibility with high tolerances to lateral/angular misalignments, and absorbs torsional vibrations.
Serrations engage with high accuracy and has significantly few backlash.
Simple structure, it can be fixed easily with a set screw and centered easily.
Oil resistant and wear resistant.

■Features (CPJL)

A flexible coupling with a simple structure by combination of 2 bodies and 1 spider.
Main body and the spider are of smooth blind fit, making for easy installation, removal and maintenance.
(Body and spider are detachable.)

Cautions

1. Do not handle as if it were of metal. The couplings are high in reliability for light loading applications. They are suitable for volumes and encoders.
2. Do not apply undue bending and torsional forces during installation. Observe the set screw tightening torque limits. (Resin material breaks if the tightening torque exceeds the allowable range)
3. The couplings are proven with heat-run tests to show 10 years of service life and 10^8 revolutions if kept under the allowable torque and misalignment values.

(Note)1. For small misalignment, use one MCJ Series for connection.
2. For big misalignment, use two MCJ Series for connection.

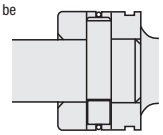
■High Strength Dowel Pins

(1)Material 1.7242/16CrMo4 Alloy Steel is carburized and ground to an m6 tolerance.
(2)Effective section is shouldered as shown and tightly engaged only on one side.
(3)Small misalignment is allowed on the mating side hole, but should be finished to an H8 tolerance.



■How to Handle Ring Spring

(1)Spring may lose its tension if once removed spring is reused.
(2)A jig as show would assist the assembly procedure.
(3)Do not leave the spring on the O.D. section for extended time periods or strike with a hammer and the like.

Compact AC Geared Motors -Guide-

■Motor Selection

1.Determination of the Driving Facility
Specify the driving facility and overall dimensions, then check required conditions for the driving facility, such as the mass and travel speed of the material to be carried.
2.Calculations for rotational speed and loads
Calculate the load torque, loading moment of inertia and rotational speed of the motor driving shaft.
3.Confirmation of Required Specifications
Evaluate the required specifications, position accuracies, position holding, speed ranges, operating environment, and environmental resistance, etc.
4.Motor Model Selection
Select the models most suitable for the specification requirements.
5.Interim Selection of Motor and Gear Head
Select motor and gearhead candidates based on calculated speeds, load torque, and inertia values.
6.Confirming the Selected Motor
Finalize the selection by confirming all the specifications of the motor and the gearhead adequately satisfy the requirements.

■Selection Example of Motors

- Required specifications
Applications: Conveyer, Operation Condition: Continuous, Voltage: 100VAC, Frequency: 60Hz, Rotational Speed: 25r/min

(1) Motor model selection
A single phase induction motor with leads (PACMS) is selected from the type chart above based on purpose, operational condition and environment, and available voltage.

(2) Interim selection of reduction ratio
Based on the target rotational speed of 25r/min, a reduction ratio 60 is selected to obtain 1500~1550r/min (induction motor rated speed in 60Hz region) divided by 25r/min=60.

(3) Calculating required torque
Approximated load is measured with a spring scale, etc. (e.g. 2.65Nm for instance)
By referring to the data for 60:1 ratio gearhead in "Allowable torque for gearheads" on **P.1000.**
a 25W motor (PMCMS80-W25-V100) and a 60:1 ratio gearhead (PMCMGX80-60) with a 200% margin.

(4) Verifying the motor by actual measurement
Usually when the conveyer starts moving the largest torque is required.
Therefore, points below are to be verified by measuring (*) the minimum starting voltage.
a. Motor Starting Torque> Required Torque (=Minimum Starting Torque)
b. Actual Measurement Rotational Speed> Rated Rotational Speed

(For example, it is assumed that the actual measurement result of minimum starting voltage is 75V with rotational speed were 1700r/min)
a. About Torque
Starting torque of PACMS80-W25-V100 is 0.16Nm from **P.1000**.
Min. starting torque=Starting torque x (Min. starting voltage/Rated voltage)2=0.16 x (5/100)2=0.09Nm
Starting torque of PACMS80-W25-V100 (0.16Nm) > Min. starting torque (0.09Nm)

b. About Rotational Speed
Rated rotational speed of PACMS80-W25-V100 is 1550rmin from **P.1000**.
Actually Measured Rotational Speed (1700r/min)> Rated Rotational Speed (1550r/min)

From the above, the PACMS80-W25-V100 motor is adequate for the case.

* Measurement method for min. starting voltage
Connect the motor with the load, and connect a variable AC transformer with a voltmeter.
Apply and raise the voltage slowly using a variable AC transformer, and measure the voltage when the equipment starts moving.

■Allowable Moment of Inertia at Gear Head Output Shaft and Motor Shaft

When a large inertial load is linked to the gear head, a large torque is instantaneously generated when a frequent, intermittent motion starts. When this shock load is too large, the gear head and motor may be damaged.
To select motors, convert inertia of load (JG) applied to gear head output shaft to motor shaft inertia (JM), to be within the values listed below. The inertia varies depending on the type of load. Refer to our website for the inertia of load applied to the gear head output shaft.

- Finding Moment of Inertia Applied to Motor Shaft

$JM=JGx\frac{1}{i^2}$

JG : Gearhead output shaft inertia [kg·cm^2]
JM : Motor shaft inertia [kg·cm^2]
i : Reduction ratio [e.g. i=5 if 1:5]

Part Number Type	A	Output (W)	Allowable Moment of Inertia at Motor Shaft			
			Except Electromagnetic Brake Motor		Motors with Electromagnetic Brake	
			JM (kg-cm2)	GD^{2}M (kgf-cm^2)	JM (kg-cm^2)	GD^{2}M (kgf-cm^2)
	60	6	0.125	0.50	0.08	0.32

	90	60	0.650	2.60	0.875	3.50
		90	0.650	2.60	1.000	4.00

*** The allowable load inertia for the 3-hase motors are for static reversal operation.**

*Inertia moments are expressed with J or GD^2. The J is generally called "inertia" and is equal to physical inertia moments used in SI Units, expressed with the unit kg-m^2. On the other hand, the unit "GD" (gee-dee-square) is typically used in industrial calculations using conventional gravitational units, and is also called a "Flywheel Effects". The units used to express are [kgf-m^2] and/or [kgf-cm^2], and the relationship between "J" and "GD^2" is: J=GD^2/4. The unit for "J" should primarily be expressed with [kg-m^2] from the physics standpoint, but [kg-cm^2] will be used here in order to simplify the calculation steps.

■Allowable Overhanging Load and Allowable Thrust Load on Gear Heads

An overhanging load applied perpendicular to the gearhead output shaft is generated when the gearhead output shaft is linked to the other machine with a chain or belt, but not when it is directly coupled with couplings.
Overhanging loads and thrust loads on output shafts greatly affect the bearing life. Ensure that applied loads do not exceed the allowed values shown below.

Part Number Type	A	Allowable Overhanging Load* N (kgf)	Allowable Thrust Load N (kgf)
(For Motor Output 40W or Less)	60	98 (10)	29 (3)
	70	196 (20)	39 (4)
	80	294 (30)	49 (5)
	90	392 (40)	98 (10)
(For Motor Output 60W or More)	90	588 (60)	147 (15)

■Service Factor

Generally load is fluctuant. When thinking of service life in such a case, use coefficient called Service Factor according to type of load.
Select Service Factor from the following table, and multiply necessary power to calculate design power.

Load Type	Example of Load	Service Factor		
		5 hours/ day	8 hours/ day	24 hours/ day
Constant Load	Belt Conveyer, Continuous One-way Operation	0.8	1.0	1.5
Light Impacts	Start, Stop, Cam Drive	1.2	1.5	2.0
Moderate Impacts	Instantaneous Direction Reversal, Instantaneous Stop	1.5	2.0	2.5
Heavy Impact	Frequently Occurring Impacts	2.5	3.0	3.5

■Allowable Torque When Gear Head is Mounted

The rotational speeds shown are based on synchronous operation speeds. Generally, the actual speeds may be 2~20% less than indicated depending on load conditions.

Output shaft rotation direction is same as the motor for [ ] cells, others are reverse rotation.

* About "Operational Limit Line"
Indicates the operational limits for Variable Speed Motor Unit. Use Variable Speed Motor Unit within the shaded areas.
If the motor is used beyond the operational limits (unshaded area), temperature may rise causing motor burn-outs.
In addition, the gears may break in gearheads.

■About Allowable Shaft Torque of Gear Head

For Variable Speed Motor Unit, the available torque is restricted, depending on the rotational speed of the motor. (Shaded area of speed torque curves on the left page)
With the following formula, calculate allowable torque of Gear Head when Variable Speed Motor Unit is used, and use within the calculated torque.

$T_P = T_M \times i \times \eta$

T_P : Allowable shaft torque of gear head to be obtained
T_M : Operation limit of speed vs. torque for Variable Speed Motor Unit
i : Reduction ratio of gear head
η : Transmission efficiency of gearheads (Left Page)

However, the maximum torque is limited to each gearhead's prescribed maximum, ("Allowable Torque for Gear Head Mounted" ☞**P.102**)
and the actual use must be kept below such given maximum values. ☞**P.100**

(Example 1) When using a 90W motor with 50:1 ratio at 500min^{-1}
The TM=0.3Nm as can be observed from the Speed/Torque Graph on the left page, and the transmission efficiency of the gearhead η=70% from the chart.
Therefore, T_P=0.3x50x0.7=10.5Nm

(Example 2) When using a 40W motor with 150:1 ratio at 1000min^{-1} (60Hz)
TM=0.16Nm and η=75%, so TP=0.16x150x0.75=18Nm, but the allowable max. torque for 150:1 ratio gearhead output shaft for 40W motor is 9.80Nm from the table on **P.1002**, so the load torque must be kept under 9.8Nm.

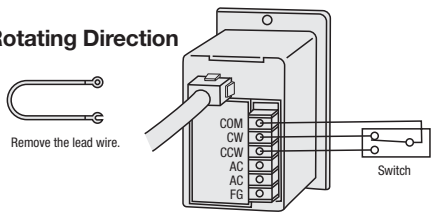
■Changing Rotating Direction



Switch Specification
- Single Pole Double Throw (SPDT) ON-OFF-ON - Power source 100V, 5A-200VAC or more - Power source 200V, 3A-400VAC or more

From the view of the motor's output shaft	
Clockwise	Connect "COM" and "CW"
Counterclockwise	Connect "COM" and "CCW"

- Unidirectional operation

Rotation direction is changed by switching the jumper wire connected to the terminal block on the back of the controller.
Connect the COM jumper to either CW or CCW.

Caution

If the motor is combined with the gear head, the rotating direction of the gear head output shaft may be reverse of the motor shaft, depending on the reduction gear ratio.

- Forward/Reverse Operation

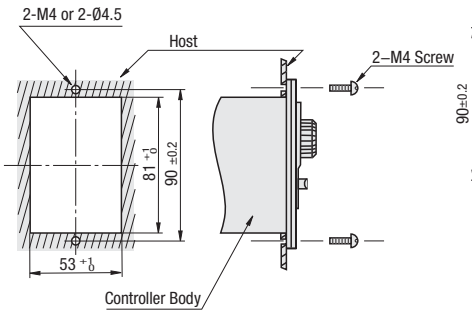
Bidirectional operation can be facilitated by adding a switch between CW and CCW terminals.

Caution

Switch the motor directions after the motor stops. Trouble may arise if switched while the motor is running.

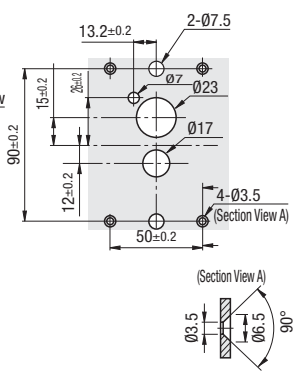
■Installation Method of Speed Controller

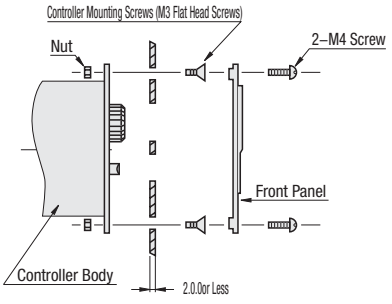
I. Installing on a square opening



(1) Cut a square opening on the install location.
(2) Combine the controller and the front panel, and mount with M4 screws.

II. Installing without a square opening





(1) Drill holes on the board.
(2) Remove the front panel from the controller body.
(3) Mount the controller body with M3 flathead screws and nuts.
(4) Mount the front panel with M4 screws and nuts.
The thickness of the board must be 2 mm or less.

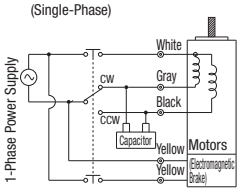
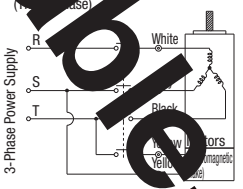
■Connection Diagram

(Single-Phase)



CW (Clockwise)

When switched to CCW side, rotates counterclockwise.



CCW (Counterclockwise)

Rotates clockwise if two of the White, Gray/Black wires are switched.

Provide a spark suppression circuit (R_1+C_1) between the contacts.

R_1=10~200Ω (1/4W or more)
C_1=0.1~0.33µF

■Allowable Torque When Gear Head is Mounted

The rotational speeds shown are based on synchronous operation speeds. Generally, the actual speeds may be 2~20% less than indicated depending on load conditions.
Output shaft rotation direction is same as the motor for cells, others are reverse rotation.

- Overview of Electromagnetic Brake Motors-

Not Available

■Features

- Power-OFF brake used will positively brake and hold the load even the power supply is turned OFF.
- The override amount for motor alone is 2~4 rotations.
- Simple switching enables up to 6 stops per minute. (Allow 3 seconds or more for each stopped state)
- The brake integrates a rectifier circuit and an AC power can be directly connected as with the motor.
- The life of brake is 1 million cycles at allowed inertia rating.

■Response Characteristics

- Electromagnetic brake motors have response characteristics such as Rise Time · Stopping Time, and Override. All of these parameters are affected by the load inertia.
- Electromagnetic brake motor's response characteristics are affected by the following three points.
  1) Motor's average acceleration torque
  2) Average braking torque
  3) Load torque and inertia
  Careful evaluation is needed on the load inertia since it varies greatly depending on the mating system.

• Time to stop and "Override"

"Override" is the number of free shaft rotations after a STOP signal is given, and calculated from the equation below considering the response time constant of the brake armature.

$$nbB=a+\frac{n}{120}\times Tb_1$$

nbB : Override (rotations) for a Motor with Electromagnetic Brake

Tb1 : Braking time

• Independent OFF and Common OFF circuits

Electromagnetic brake motor's stopping time constant will vary depending on where the switch is placed within the circuit.
With the Common OFF circuit, the motor coil and the brake coil form a closed loop circuit, and the residual energy from the motor will affect the brake coil time constant.
As a result, the brake armature release is delayed and the motor will require more time to stop. For applications requiring short stopping performance, use the Independent OFF circuit.

TM Magnetic Transmission Drive (Parts for Non-contact Magnetic Force Transmission)
-Overview-

■Overview
Force is transmitted non-contact by the principal of attractive force of magnetism.

■Features
- Particle generation can dramatically be reduced.
- Ultra quiet operation
- Can be used semi-permanently within the allowed range of use, due to its permanents.
- When extraordinary load is applied, two magnets turn separately and work as a torque limiter.
- No backlash.
- Possible to use in water.

■Selection Steps
(1) According to transmission direction, select orthogonal type or parallel type.
(2) Calculate the required quantity from the size and the distance of the work to be carried.
(3) Calculate the required torque from the weight and quantity of the work to be carried.
(4) Select the matching product from the right page.

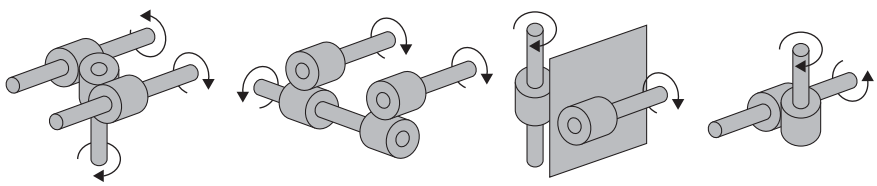
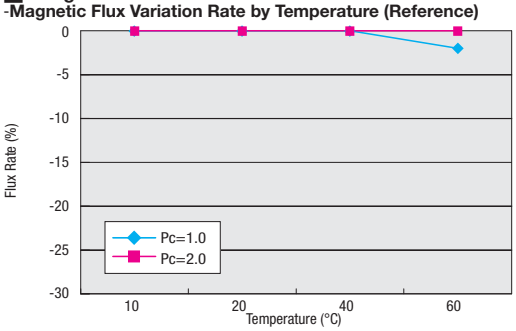
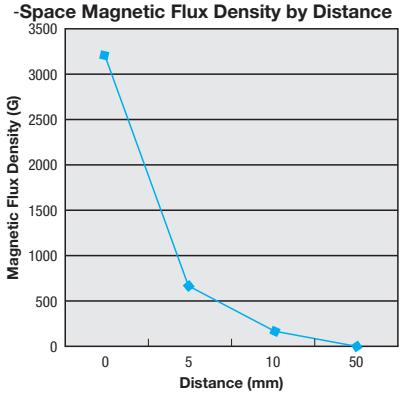
■Example of Use
·Two Rotary Shafts ·Conveyance Transmission ·Bulkhead Transmission ·Angle Change



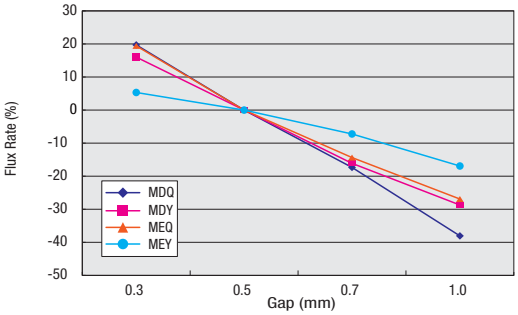
■Design Data
-Magnetic Flux Variation Rate by Temperature (Reference)



-Space Magnetic Flux Density by Distance



-Torque Rate by Distance Change (Reference)



-Cautions
- No alteration is available for the magnet parts.
- Strong impact may cause damage and lead to deterioration in magnetic force.
- The following objects are negatively affected by strong magnetic field.
  Electric devices such as cell-phones, PCs and watches.
  Medical electronics such as pacemakers, etc.
- For its non-contact nature, not suitable for extremely high-speed rotation.
  (Maximum rotational speed 1500rpm)

Urethane, Silicon Rubber and NBR are baked on the roller's outer diameter.

When L≤dx3, hole d is machined from the same direction.

When L>dx3, hole d is machined from both ends as shown below. There may be no relief in some cases.

*Data above are for reference only, not guaranteed values.

Urethane, foam urethane and chloroprene rubber sponges are press-fit into the core. Therefore, unbalanced load may cause urethane and sponge part to slip or misalign with the core.
Urethane may discolor over time, but there is no effect on physical properties.

■Foam Urethane

Closed-cell foamed urethane. Each bubble is divided by walls resulting in lower absorption of water, oil and chemicals compared to general sponges with connected cells. Also, it excels in gripping power and shock absorption compared to conventional urethane and other general rubber products. Especially suitable for conveying thin materials.

■Chloroprene Rubber Sponge

Synthetic rubber made of polymerized chloroprene. Superior to natural rubber in resilience, weather fastness and ozone resistance, and also features resistance to heat, cold and oil. While it is a well-balanced rubber material, it is not suitable for use in low temperature (less than -35°C). Mainly used for general industrial products.

For characteristics, please see P.2-358

■Features

- As the bearing inner rings protrude, there is no need to combine stepped shafts or collars for mounting.
- The urethane part is a multi-layer structure consisting of tire section and wheel section (single layer for D20 to D35). It is economical as small diameter shafts can be used even for rollers with large external diameter.
- The bearings used have special configuration to prevent the urethane from detaching.
- Though it excels in oil resistance, applying solvents may cause swelling and reduction in strength.

Motor Rollers Guide

Selection Method

(1) Calculate the required tangential force

◆Formula for the required a force

Required Tangential Force (N) = 9.8 (constant value) x Object (kg) x Rolling Friction Coefficient

◆Rolling Friction Coefficient Chart

Wood	Metal	Cardboard	Plastic	Rubber Lining
0.02~0.05	0.01~0.02	0.05~0.1	0.02~0.04	0.1

Above values vary by roller pitch or condition of roller surface, etc..

Sample Calculation When carrying a cardboard box of weight 40 (kg)

* From the above chart of Rolling Friction Coefficient, maximum friction coefficient for cardboard is 0.10.
Required tangential force=**9.8x40 (kg)x0.10=39.2 (N)**

* Rolling friction coefficient depends on the material of the object. Refer to the table above.

(2) Select the model provisionally

Select the model that matches the caring speed from the specification table on the right page.

Example When carrying the objects at the speed of 20m/min, MOR57–(Length)–20.

(3) Determine the number of required rollers

Determine the number of required rollers considering the following 2 elements.

- Motor Roller Tangential Force (Start-up or at rated output) - Carried weight and Roller allowable static load (Please see the standards table "Roller Strength (N)" on right)

◆
Calculate the required tangential force
Carrying Capability (N) = Starting Tangential Force of the Motor Roller (N) x 0.9 (Constant value)

◆
Determine the number of required rollers
The Number of Required Rollers = Required Tangential Force (N) / Carrying Capability (N)

Sample Calculation Required tangential force for carrying is 39.2 (N) from the sample calculation above.

When MOR57–(Length)–20

•Carrying capability is 55 (N) (Starting tangential force) x 0.9 = 49.5 (N).
•The number of required rollers is 39.2 (N) (Required tangential force)/ 49.5(N) (Carrying capability) = 0.79 (pcs)…1roller is required to carry.

(4) Determine the length of the rollers

- Determine the length of the rollers from the size of the bottom surface (length and width) of the object

Sample Calculation When the length of the bottom surface is 300mm and the width is 400mm
- The width of the object is 400mm + Margin 100mm = 500mm.

It follows that in this case, the part numbers should be **MOR57-500-20**

[Caution in selection]

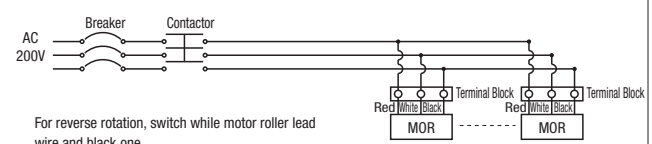
* The calculated value using carrying tangential force gives the minimum value for required tangential force needed to carry the work. Transfer capability could vary depending on roller level differences, carried object bottom surface shape (conditions) and material, motor roller speed, etc. Please use more rollers depending on usage conditions and considering safety. If rated speed is important, use rated tangential force for calculation.
* When motor rollers are loaded at all times, use rated tangential force in calculating for selection.
* The object is assumed to start from on the motor rollers.

Features

- Built-in motor and gear enables space savings for driving mechanisms.
- Requires no maintenance such as lubrication.
- With multiple motor rollers used depending on transfer load size, one of the rollers in trouble does not result in production line shutdown.

Circuit Layout Diagram

3 Phase, 200V



- For reverse rotation, switch white motor roller lead wire and black one.
- Normal / reverse rotation can be changed by switch.
- When red, white and black wires are connected in the identical manner, the rollers will rotate in the same direction.

Applicable voltage variation for 50Hz is ±3%. (When 60Hz, up to ±5% of voltage variation is applicable.)

kgf=Nx0.101972

In case 50Hz is applied at ±5% of voltage variation, torque value diminishes by 40% from the values shown in the table above.

Speed in the table indicates the values at rated current. Also rotational velocity and torque change when load is light or excessive.

Roller strength varies considerably by extent of impact load, weight or material of the object. Add extra value to allow for a margin. (recommended additional value: 1/3 to 1/2 of the above value)

Roller Conveyor Overview

■ Selection Method of Roller Conveyors

(1) Selection of Roller Width

Select a roller width according to an outer size of conveyed objects.
1. Optimum width selection is "Object width + 50mm or more".
2.If the objects to be conveyed are on pallets, it is acceptable for the roller width to be narrower than the object width as long as the objects do not come into contact with the conveyer frame.

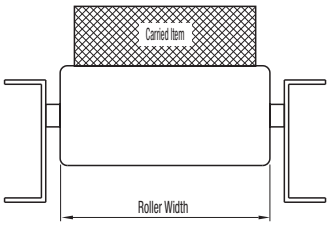
(2) Selection of Roller Pitch

Roller pitch is determined by surface length and mass of conveyed object.

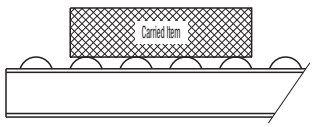
-When the conveyed objects have hard bottoms
When the objects have hard bottoms, such as steel, plastic etc., select a pitch that always supports the objects with more than 4 rollers (>3 pitches).

-When the conveyed objects have soft bottoms
When the objects have soft bottoms, such as cardboard and rubber etc., select a pitch that always supports the objects with more than 6 rollers (>5 pitches). In addition, make designed load per roller within the allowable values shown in the table below.

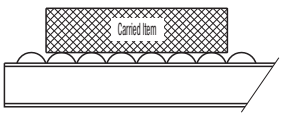
-When impact is generated upon loading
When impact is generated upon loading, impact load is 1.5~3 times larger than the usual load. Please select the conveyor with ample load capacity.



- When the product bottom is hard



- When the product bottom is soft



■ List of Strength per Roller

Roller Outer Diameter	Roller Strength (N)				
	W113	W213	W313	W413	W513
19.1mm	618	530	343	294	206
28.6mm	1236	1059	687	588	412
38.1mm	1342	1342	922	785	588

(3) Selection of Gravity Feed Inclination

When Roller Conveyors are installed at an incline, conveyed products move by own weights. This inclination is called gravity feed inclination. Gravity feed inclination varies depending on the condition of the bottom, material and a mass of the conveyed products.

1. Refer to the right chart for selecting. The chart shows approximate values for flat bottom objects.

Cautions on the usage of tapes

(1) Remove contamination including dust, grease and water.
(2) Some materials have low adherence properties..
(3) NLTP attached 1 or 2 days prior to assembly will have higher bonding strength.
(4) RMT bonds well to ultra high-molecular-weight polyethylene (UHMW).

Miniature Conveyor Guide

■Overview · Features

Belt Conveyors suitable for use in automated machinery.

Feature 1: Space-saving design; one of the most compact conveyors in the market **with the size of 30mm in width x 200mm in length.**
Feature 2: Lightweight but rigid by the use of extruded aluminum sections for frame sections.
Anodizing is applied and corrosion-resistant.
Feature 3: Design of frame slots allows accessories to be installed easily.
Feature 4: Min. **10th day shipping** and quick delivery

■Product List

Number of Tracks	Belt	Driving Position: Head Drive	Driving Position: Center Drive	Driving Position: Built-in Drive
		Tension adjustment is easy because the non-driven tail roller also acts as a tension roller. It is reasonably priced and uses a smaller number of parts.	Belt tension can be adjusted at the center drive section. Overall length does not change after tension adjustment. Drive section is easily movable within the adjustment range.	The built-in motor between frames has resulted in space savings.
Single Track Broader carrying surface can convey various shapes of work pieces.	**Flat Belt** Flat belt is selectable from two types for your purpose. ■Selectable Flat Belts Use / Type / Color / Page General Purpose / HBLT (W) / Green / [illegible] For Sliding / SHBLT (W) / White / [illegible]37	 P.1073 · 1074	 P.1075 · 1076	 P.1077

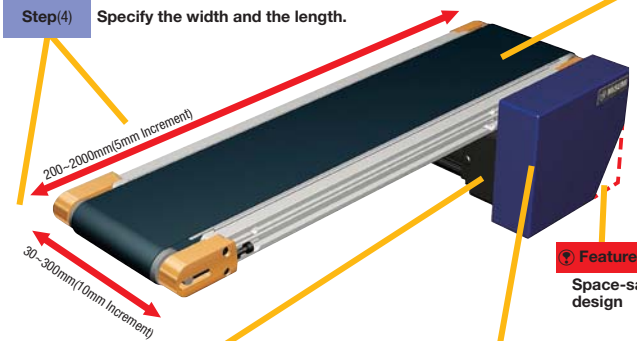
■How to select

Select miniature conveyors by following the steps below.

Step(1) Select a type and the number of tracks for conveyance.

Selectable	
Single Track (Flat Belt)	Dual Track (Timing Belt / Plastic Chain)
 Broader carrying surface can convey various shapes of work pieces.	 Clearance between tracks allows installation of stoppers and sensors. Two tracks are synchronously driven by the use of timing belts and engineering plastic chains.

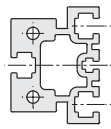
Step(4) Specify the width and the length.



Features Space-saving design

Features Easy attachment of accessories

*Ex. Frame for CVSB (Flat Belt, Pulley Diameter φ50)



Features General purpose hexagon nuts can be used for frame slots.

Step(2) Select a driving position.

Selectable		
Head Drive	Center Drive	Built-in Drive
 The non-driven tail roller also acts as a tension roller. It is reasonably priced, and uses a smaller number of parts.	 Belt tension can be adjusted at the center drive section. Overall length does not change after tension adjustment. Drive section is easily movable within the adjustment range.	 The built-in motor between frames has resulted in space savings.

Step(3) Select a motor.

Selectable	
Induction Motor	Variable Speed Motor
Motor with constant speed. Suitable for the continuous one-way operation. Also usable for the intermittent operation with relatively-long intervals.	Variable Speed Motor. Comes with a control box with which conveyance speed can be adjusted. Control box is not fixed on the conveyor and can be installed for your purpose.

Panasonic motors and Oriental motors are selectable.

■Belt Replacement · Chain Replacement

Please note the followings when replacing belts.

(1)Minimum pulley diameter of belts / No. of Plastic Chains
There is a limit on minimum pulley diameter (bending diameter) of belts.Please refer to flat belts on **P.1087** and timing belts on **P.1923** and confirm the pulley diameter of the selected miniature conveyor. For plastic chains, select the right plastic chain suitable for No. 40 sprocket (No. of teeth: 14).

(2)Calculations of Belt and Plastic Lengths
Calculate and confirm the belt length by referring to the table below.

(3)Direction of Conveyance
Please note that some belts have a specified direction of conveyance.

■Flat Belts
Seven types of MISUMI flat belts are available: General Purpose, Sliding, Inclination, Electronic Parts Conveyer, Food Conveyer, Heat-Resisting and Oil-Resisting.
Belt Width Configurable Type and meandering prevention Crosspiece Type are also available.

Features		Conveyor flat belt for most general purposes.	Belt surface has a small friction coefficient. Suitable for accumulating conveyance.	Belt surface has a large friction coefficient. Inclined transfer is possible.	Provided with antistatic finish. Suitable for conveyance of static-sensitive electronic components.	Satisfies No. 370 Notification concerning Food Sanitation Laws, and standardized protections against bacterium, mould and fray (ear part fray).	Heat-resistant belt up to 180°C in continuous use. Suitable for conveyance of work with heat.	Oil-resistant vinyl chloride and urethane are used for belt surface. Suitable for conveyance of work with cutting fluids, etc..

· Conveyance belt for food has the function compliant with HACCP.
*HACCP ·····Hazard Analysis (and) Critical Control Point
A technology developed by National Aeronautics and Space Administration (NASA) for sanitary control of space foods, which is applied to sanitary control in food industries and restaurants.

· Storage Cautions
- Avoid direct sunlight.
- Store in a place with no rain fall.
- Store in a place with humidity of less than 80%, temperature of 0°~40°.
- Do not store in stacks and avoid bending during storage.
- Do not put them directly on the ground.
- Avoid contact with oil and chemicals.

■ Pulleys and Idlers for Flat Belts
MISUMI pulleys and idlers for flat belts are offered in a wide variety of shapes and sizes.
You can choose the most suitable product for your needs, such as meandering and slip prevention.

[Pulleys / Idlers for Flat Belts List by Type]

■ Round Belts
Five types of MISUMI round belts are available: Standard Type, High Tension Type, Conductive Type, Seamless Type and Hollow Rope Type.
Also, Weld Jointed or Open End are selectable for Standard Type and High Tension Type.

Features of Round Belts
Suitable for conveying lightweight objects. Flexible on designs such as multi-shafts transmission or right angle transmission.
High elasticity and hardness, and excels in abrasion resistance, oil resistance and weather resistance.
Not applicable to aromatic compounds (toluene, benzene, naphthalene, etc.). Avoid using or storing in humid conditions.

Features

·Welded Joints (Standard Type / High Tension Type / Conductive Type): MBT·MBTH·MBTD

Round belt of rope shape is cut into any specified length and made endless with heat welding.
Though connecting section may look thicker, appropriate diameter can be obtained when tension is being applied during operation.
MBT and MBTH both satisfy the Food Hygienic Regulations.
MBTD is a Round Belt with conductive material (Carbon) kneaded. Usable under various conditions affected by static electricity

·Open End Type (Standard Type / High Tension Type): MBT-N·MBTH-N

Cut by meter sections only. Endless jointing is not applied.
MBT-N and MBTH-N both satisfy the Food Hygienic Regulations.

·Hollow Rope Type: MBQ

The cross section is hollow in the center, and no endless jointing is applied before shipping.
Simple and reliable endless connection is possible by cutting the belt in any length and inserting a dedicated metal jointing parts MBQC.
Satisfies the food and hygiene standard in accordance to the Notice No. 434 of Japanese Ministry of Health and Welfare.

(How to Connect)
Cut the round belt in the length of 5% shorter than the calculated or actual measured length with a knife at a right angle. Hold the dedicated metal joint MBQC by using a pair of pliers.
Insert the metal joint up to the center of the hollow belt end.
To help the insertion in a cold season, warm the belt by immersing in warm water of 40°C for 1~2minutes.
Ensure not to damage the edge of the metal joint.
Insert the metal joint into the other side of the belt.

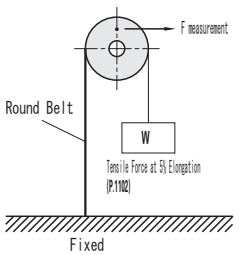
Slip torque is improved with a trapezoidal grooved pulley, as it contacts belts with 3 surfaces, while U-grooved pulley contact belts with one surface.



The values are for reference. Difference may vary depending on operating environment.

Timing Pulley and Belt Overview

Timing Pulleys

MISUMI timing pulleys are shaft bore machined and surface-treated. In addition to regular pulleys,
- wide variety of pulleys including significantly reduced backlash pulleys
- MechaLock incorporated keyless timing pulleys are available.

Usage	Features	Type of Belt	Pitch	Timing Pulleys			Idlers	
				Timing Pulleys	Keyless Timing Pulleys	Clamping Timing Pulleys	Idlers with Teeth	Idlers
								
				General purpose pulleys, surface treated and bores pre-machined.	MechaLock incorporated timing pulleys, easy phase matching.	Timing pulleys easily fastened to shafts with a single screw.	Surface-treated and bearing incorporated idlers with teeth.	Idlers without teeth used for tensioning on belt backsides.
Regular Torque	General purpose timing pulleys suitable for torque transmission and light load conveyance.	MXL	2.032mm (2/25inch)	P.1121	-	-	P.1175	P.1187
		XL	5.08mm (1/5inch)	P.1123	P.1154			
		L	9.525mm (3/8inch)	P.1125	P.1155-1156		P.1177	
		H	12.7mm (1/2inch)	P.1127	P.1157-1158			
High Torque	Timing pulleys for high torque transmission.	S2M	2.0mm	P.1129	-	-	P.1179	
		S3M	3.0mm	P.1131	P.1159-1160	P.1171

		P5M	5.0mm	P.1143	P.1165			
		P8M	8.0mm	P.1145	P.1166			
High Accuracy Positioning	Timing pulleys with small backlash. Suitable for positioning.	2GT	2.0mm	P.1113	-	-	P.1183	
		3GT	3.0mm	P.1115				
		5GT	5.0mm	P.1117				
		8YU	8.0mm	P.1119				
Light Load Conveyance, Regular Torque	Trapezoidal toothed timing pulleys suitable for conveyance. Also usable for transmission.	T5	5.0mm	P.1147	P.1167-1168	-	P.1185	
		T10	10.0mm	P.1149	P.1169-1170			
Heavy Load Conveyance	Timing belts suitable for heavy load conveyance. Possesses 1.3 times larger allowable tension than T type.	AT5	5.0mm	P.1151	-	-	P.1185	
		AT10	10.0mm	P.1151				

Significantly reduced backlash timing pulley is available for S8M (**P.1139**). Special timing belts are not required.

Timing Belts

MISUMI offers many kinds of timing belts for the customers.
Conventional Timing Belts for Transmission, Timing Belts with Attachments for Conveyance, Tooth Count Configurable Long Timing Belts, and Open End Belts are available. The GT series suitable for high accuracy positioning is newly added to the product lineup.

Usage	Type of Belt	Pitch	Timing Belts			Timing Belts								
			Timing Belts		With attachment Timing Belts	Long Timing Belts No. of Teeth Configurable Type		Long Timing Belts No. of Teeth Configurable, Cloth Type		Open End Belts		
												
			General purpose timing belts for transmission.		Belts with attachments for conveyors.	Number of teeth specifiable type. Can be specified up to 10m.		Timing belts with low friction cloth. Most suitable for accumulation conveyance and noise reduction.		Most suitable for reciprocal motion. Various metal joints are available.

MTS8M belts are applicable to S8M timing pulleys and idlers. UP5M, UP8M belts are compatible with S5M, S8M timing pulleys and idlers.
EV5GT belts are applicable to 5GT and EV8YU belts are applicable to 8YU timing pulleys and idlers.
Iron Rubber® is the trademark of NOK Corp. Pulleys compatible with MA_ belts are available on our website.

For Design Data, refer to **P.1943**

Cautions

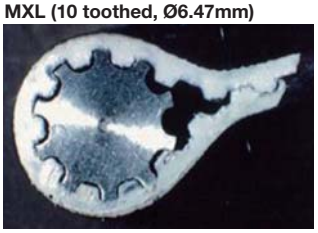
- Do not bend belts too hard.
- When core wire is steel cord, avoid giving tension from the backside.
- Avoid using and storing the products in an environment of extremely high or low temperature (beyond the operating temperature) and humid.
- Avoid direct contact with water, solvent, oil, acid, alkali, ultra-violet light, ozone, etc. If the belt swells its service life will be considerably shortened.
- Make sure to shut down the machine and confirm the complete stop of its behavior before starting installation or maintenance check.
- Timing pulleys and belts (MXL, XL, L, H) for general use are compliant with JIS and ISO Standards.
  Timing Pulleys: JIS B 1856 (ISO5294)
  Timing Belts: JIS K6372 (ISO5296-1), JIS-K6373(ISO5296-2)
- S Type (S_M) timing pulleys and belts are compatible with S_M Type from Mitsuboshi Belting Ltd. as well as Bando Chemical Industries Ltd.
- MTS Type (MTS8M) belts are compatible with MTS8M from Mitsuboshi Belting Ltd.
- P Type (P_M) timing pulleys and belts are compatible with P_M Type from Tsubakimoto Chain Co.
- UP Type (UP_M) timing belts are compatible with UP_M-HC Type from Tsubakimoto Chain Co.
- MA Type timing pulleys are compatible with MA_Type from NOK Corporation.
- GT Type (_GT) and EV Type (EV5GT, EV8YU) timing pulleys and belts are compatible with _GT, EV5GT, EV8YU Types from Gates Unitta Asia Company.

Features of GT Belts

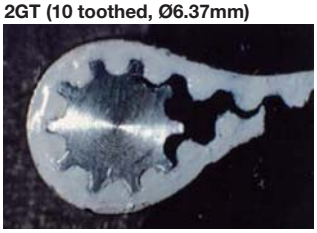
- The tooth engagements occur based on involute motion that closely assimilates the profiles of both teeth, thus minimizing backlash and making the scheme suitable for high accuracy positioning applications.

*Backlash means the clearances between the belt tooth surface and the pulley tooth surface when engaged.

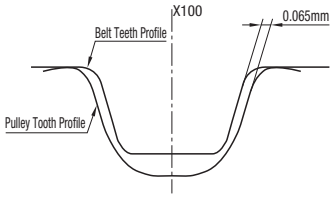
MXL (10 toothed, Ø6.47mm)



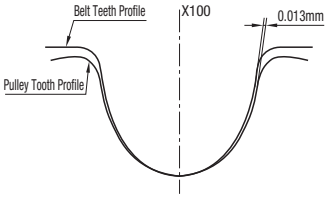
2GT (10 toothed, Ø6.37mm)



Reference: Comparison of Static Backlashes



Static backlash between the MXL Type belt and the pulley (No. of Pulley Teeth: 20)



Static backlash between the 2GT Type belt and the pulley (No. of Pulley Teeth: 20)

Features of Non-backlash Pulleys (S8M)

- Non-backlash pulley is a timing pulley whose backlash is reduced to work with high-accuracy positioning mechanism by timing pulley belt.
- Backlash is significantly smaller than standard pulleys. (The amount reduced depends on application.)
- Use regular S8M timing belt.

Reference: Comparison of deviation angles between non-backlash pulleys and standard pulleys

Keyless Timing Pulley
-Overview-

■Features of Keyless Timing Pulleys

- Machining on shafts such as keyway is not required.
- No machining on shafts retains the strength of shaft.
- Easy positioning.

■Installation

(1) Wipe off the shaft surface and apply oil or grease.
(Do not use any oil or grease containing molybdenum type elimination agent.)
(2)Wipe off and apply oil or grease on contact surfaces of pulley and bushing as well. Apply to the threads and seat of tightening screws as well.
(3) Temporarily assemble the pulley and bushing, then insert the shaft.
(Do not tighten the bushing before inserting the shaft.)
(4)After locating, tighten the clamping screws using a torque wrench in the diagonal line order, beginning lightly (approx. 1/4 of the predetermined tightening torque).
(5)Tighten the screws further to an increased torque (approximately 1/2 specified torque).
(6) Tighten the screws up to specified torque.
(7) Finally, tighten the screws to the listed torque values in a circumferential order.

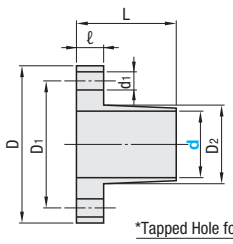
■Note on Installation

- Be sure to apply oil or grease at mounting. If not, the pulleys may not be tightened firmly; the shaft may slip at rotation.
- Screw tighten the bushing after inserting the shaft.
(Bushing deforms if the screw is tightened before inserting the shaft.)
- Use a torque wrench to tighten the screws.
- Do not use screws other than the included tightening screws.

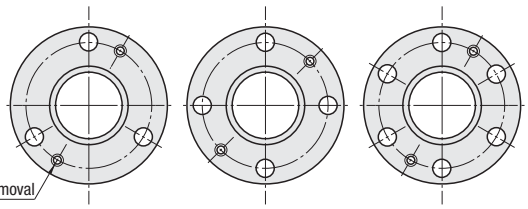
■Removal

- Be sure to work after the system is completely shut down.
- Loosen the tightening screws in circumferential order.
- Insert a screw in a hole for removal and tighten evenly.
- Repeat "Installation" process for re-installation.

No slits on SH bushings



*3-Screw Tightening Type 4-Screw Tightening Type 6-Screw Tightening Type



Operating Temperature: -20~+80°C

*SH bushings have 3 tapped holes for removal.

Material: Body 1.1191/C45E

- Shaft tolerance g6, shaft surface roughness Ra6.3 are standard.
- When there are keyway and D cut on the installation shaft, transmitting torque is reduced by approximately more than 15%.

■Mechanical Lock Standard Type Incorporated

In addition to the above bushings, Mechanical Lock Standard Type (☞P.1217) incorporated keyless timing pulley is newly added to the lineup.
It tolerates average 1.2 times and 2.5 times greater torque against ST bushing and SH bushing respectively.

Keyless Timing Pulleys L Type

-MechaLock Standard Type incorporated (with centering function)-

CAD Data

Features: MechaLock Standard Type (P.1217) incorporated timing pulleys. It tolerates an average of 1.2 times and 2.5 times greater torque compared to the conventional ST bushing and SH bushing respectively.

CAD Data

Features:MechaLock Standard Type (P.1217) incorporated timing pulleys. It tolerates an average of 1.2 times and 2.5 times greater torque compared to the conventional ST bushing and SH bushing respectively.

Price

For the body price of HTTK, multiply the body price in the table by coefficient 1.1.(Round down to ten Cent.)
(Body Price + MechaLock Incorporation Charge) = Product € Unit Price
Ex.) When HTTK20T10150-E-18
Body price in table(54,90) x Coefficient(1.1) + MechaLock incorporation charge (35,30)= 95,60 EUR

Super High Torque Timing Belts (EV5GT / EV8YU)

■**Features:**Suitable for linear motion drives since circular-arc tooth profile causes little backlash.
■EV5GT is compatible with the High Torque Timing Pulley 5GT on P.1117, while EV8YU is compatible with the High Torque Timing Pulley 8YU on P.1119.

High Torque Timing Belts (S2M, S3M, S5M, S8M, S14M)

Although some tooth fabrics for MXL and XL rubber belts (TBN) are change from black to brown (bear-back specifications) for preventing rubber-dust, it does not affect the performance.

For Long Timing Belts No. of Teeth Configurable Type, refer to P.1203

Operating Temp.
Rubber: -30~90°C
Polyurethane: 0~80°C

RoHS

Type	Material	
HTBN	(1)Back Rubber	Chloroprene Rubber

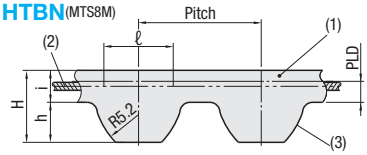
Super High Torque Timing Belts (MTS8M / UP5M / UP8M)

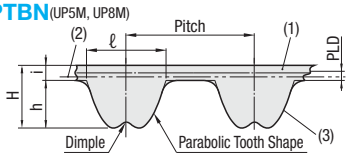
CAD Data

Features: As having nearly doubled transmission capacity compared to standard timing belts, higher-load transmission and limited space design can be realized.

HTBN (MTS8M)



PTBN (UP5M, UP8M)



Features and Cautions P.1112
Selecting Method P.1923

Type	Material	
HTBN	(1) Rubber	High Hardness Synthetic Rubber Hardness 88°
	(2) Core Wire	Glass Core Wire
	(3) Cloth	Nylon Cloth

Operating Temperature: -30~90°C
Applicable to the Timing Pulley S8M type. P.1135
Backside color of MTS8M is black.

Type	Material	
PTBN	(1) Rubber	Chloroprene Rubber
	(2) Core Wire	Glass Core Wire
	(3) Cloth	Nylon Cloth

Operating Temperature: -25~80°C
Applicable to Timing Pulleys P5M and P8M types. P.1143~1146
Rubber color of UP5M on the back side is black and that of LP8M is blue.

Timing Belts with Attachments (T5 / T10)

- Joint Processed -

■Attachments are thermally bonded to the backside of the Timing Belt. It enables a constant pitch conveyance of various work pieces. For Timing Pulleys, refer to P.1147-P.1149

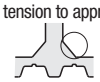
- The attachment is mounted on the backside above the belt teeth.
- Attachmentis mounted on the center of the belt.
- Jointing process reduces allowable tension to approx. 50% of open end belts.
- Adhesion burrs occur at the base of the adhered attachment.



- For material properties of polyurethane for joint process, refer to P.1200
- For allowable tension of belts and documents for design, refer to P.1940
- If the attachments are to receive vibrations or large loads, test the applicability before using.

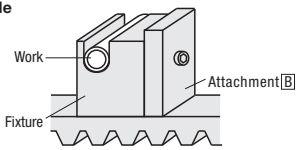
•Tolerance of Mounting Pitch Attachment (mm)

Mounting Pitch	Tolerance of Mounting Pitch
30~200	±0.5
300~	±1.0

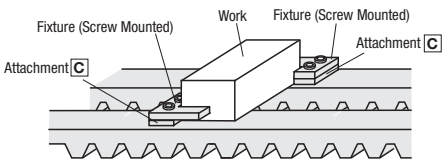
•Attachment Dimension Tolerance (mm)

Dimensions	Dimension Tolerance
A	±0.5
B	±0.5
T	±0.5
C	±0.1

Example



Attachment B allows mounting of work-piece specific fixtures.



Attachment C allows screw-mounting of fixtures/brackets from above, providing freedom in work-piece heights and shapes.

■Joint process

The Open End Belt can be changed to an endless belt by heat-sealing the ends of the Open End Belt.
Core wires of the joint part are not connected.

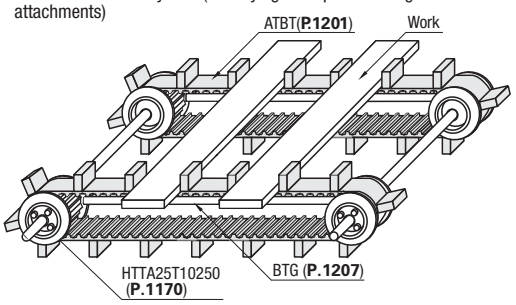
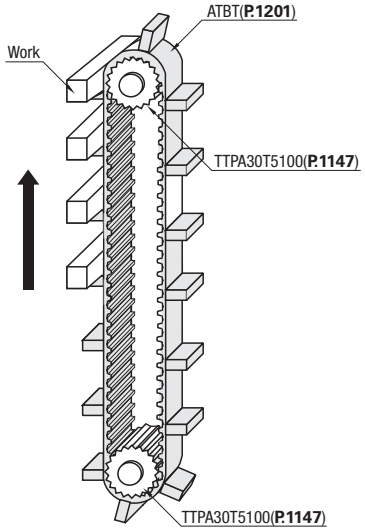
■Long Timing Belts / Open End Belts (P.1201-1206) Example of Use

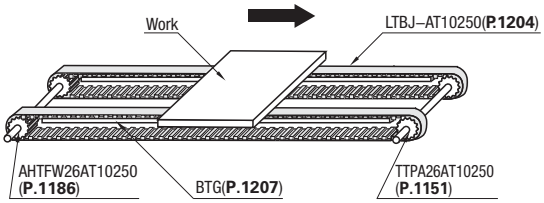
- Simultaneous Conveyance (Conveying work pieces at regular intervals using attachments)



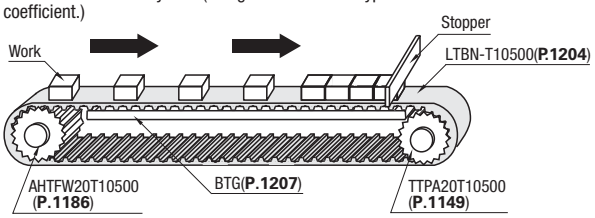
- Vertical Conveyance (Conveying with light work pieces on attachments)



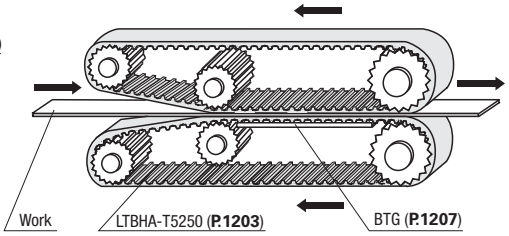
- Circuit Board Conveyance (Conveying boards on two timing belts)



- Accumulation Conveyance (Using the Cloth Lined type to reduce friction coefficient.)



- Tractor Conveyance (Sandwiching work pieces between belts)



- Linear Drive (Reciprocating motion with open end belts)

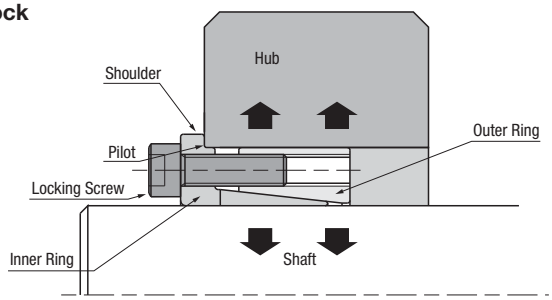
MechaLock
-Overview-

Features of MechaLock
- The Mecha-Lock is a fastening tool to tightly fasten a hub to a shaft by using friction. This is accomplished by converting screw tightening power into pressure on the tapered inner diameter surface of the hub, and the tapered outer diameter of the shaft.
  A hub (such as pulleys, gears and sprockets) can be easily connected with a shaft by screwing.
- It is well suited to applications with repeated forward / backward rotation as it virtually eliminates backlash.
- It can also handle some thrust.
- Design allows for infinite phase adjustment after installation.
- It saves complex key machining on shafts and hubs as well as polishing in assembling, which leads to total cost reduction.

Structure of MechaLock



Installation
(1) Wipe off the shaft surface and apply oil or grease.
(Do not use any oil or grease containing molybdenum type elimination agent.)
(2) Wipe off and apply oil and grease on contact surfaces of MechaLock and Hub.
Apply oil or grease to the thread and seat of lock screws.
(3) Please insert the shaft after assembling the MechaLock and Hubs temporarily.
(Please do not tighten the screws before inserting the shaft.)
(4) After locating, tighten the lock screws using a torque wrench in the diagonal line order, beginning lightly (approx. 1/4 of the predetermined tightening torque).
(5) Tighten the screws further to an increased torque (approximately 1/2 specified torque).
(6) Tighten the screws up to specified torque.
(7) Finally tighten the lock screws in circumferential order.

Note
-Be sure to apply oil or grease at mounting. If not, the MechaLock may not be tightened firmly; the shaft may slip at rotation.
-Tapered portion of Inner ring and outer ring will get into each other even with a little shock from conveyance. Loosen the screw and nut and disassemble parts to release tapered parts before installation.
-Please insert the shaft after assembling the MechaLock and Hubs temporarily. (Please do not tighten the screw before inserting the shaft. MechaLock may deform.)
-Use torque wrench to tighten screws.
-Do not use lock screws other than those included.

Removal
- Be sure to work after the system is completely shut down.
- Loosen the lock screws in circumferential order.
- Insert a screw in a hole for removal and tighten evenly.
- Repeat "Installation" process for re-installation.

Features	Because the screw is installed directly on the hub, the inner and outer diameter difference is small and thin. Applicable to installation on a small hub, also. Best suitable for the aluminum belt pulley, etc.	Because mounting tap of the screw is built in the flange, the inner and outer diameter difference is small and thin. Applicable to installation on a small hub, also. Centering function is equipped.	Most widely used locking mechanism. High-performance centering function. Available in wide range of sizes, materials and types of surface treatment.	Has larger maximum allowable torque than Standard Type, and locks the shaft and hub firmly. Compact Straight Type for high torque is also available.	Installation can be completed by tightening one nut and is much easier than the conventional lock screw type.

In the case of shafts with keyway, the MechaLock can be installed on such shafts if the groove width is within JIS Standard. However, allowable torque and allowable thrust load will become 15~20 % smaller.

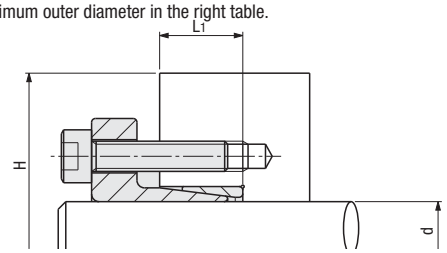
How to Determine Hub Outer Diameter

After selecting MechaLock size as well as hub size and material, confirm that the selected values meet the conditions H≤hub minimum outer diameter in the right table.



Recommended Tolerance of Shaft and Hub

Shaft Outer Diameter	h7 (g6)
Hub Inner Diameter	H7

Finish surface roughness at or below 1.6a in shaft and 3.2a in hub.

Features

- Small difference between the inner and outer diameters makes it possible for compact design.
- Hub does not move when tightened because the inner ring touches the end face of the hub.
- It has a function (centering function) to control pendulum of the end face and the circumference of the hub against the shaft.

■Features

(1) With pilot on flange of the inner diameter, the tightening lock screw presses hub inner diameter. This generates effect to control instability on the hub end face and outer diameter (centering effect).
(2) Free phase adjustment and positioning.
(3) No hub movement in axial direction when tightened with lock screw.
(4) No backlash after tightening.

Gears -Overview / Technical Data-

MISUMI gears have machine finished shaft bores and treated surfaces.
The lineup includes: general purpose spur gears, high performance gears such as induction hardened gears and bonded plastic gears, original products such as keyless hub gears and bearing integrated gears.
Various types of gears like bevel, helical and rack gears are also available.

	Standard spur gears most widely used.	Excels in strength and friction resistance.	Plastic Type relatively quiet when engaged.	Plastic spur gears that can be mounted tightly to shafts.	Spur gears that don't require machining to shafts. Easy phase matching.	Gears with integrated bearings, suitable for rotation reversing idler gear.

	Convert between rotating motion and linear motion. Length and mounting hole machining can be specified.	Convenient for reciprocal motion of the rack side.	Used for perpendicular transmission.	Used for perpendicular transmission of unparalleled shafts.	Perpendicular transmission of unparalleled shafts makes these gears suitable for power transmission of large deceleration and high torque.

■Bonding Strength and Safety Factor

(1)The fusion bonding strength of MC nylon and cores vary depending on bonded areas.
See Fig.1 for the relations between bonded diameter and radial strength (torque), and Fig.2 for bonded diameter and thrust strength.

(2)For the bonded strength obtained in (1), apply 4 ~ 5 as safety factor.
If ambient temperature rises, multiply the correction coefficient in Fig. 3.

(3) Allowable strength is as follows:

Tal = Tmax. x 1 / Safety Factor x T

Tal: Allowable Fusion Bonded Strength
Tmax.: Fusion Bonded Strength in Fig. 1 or 2

⊗Shaft bore diameter 9N is not available for Keyway Bore + Tap. ⊗When hub length (W)<M+3, Straight Bore +Tap and Keyway +Tap are not available. ⓟ When the tooth width is smaller, the transmitting torque is smaller. ⓟShaft bore diameter 6.35 is available for Straight Bore and Straight Bore + Tap. ⓟSelect 10K as P dimension if you request keyway width of 4.0mm (height 1.8mm) for Keyway + Tap with shaft bore diameter of 10. ☞P.1222 ⓟWhen requesting A shape (no hub), Specify W=0 ⓟWhen W=0, specification for H dimension is not required.

Notes on Installation

- When installation, be sure to apply oil or grease.
  When oil or grease is not applied, shaft may slip because of inadequate tightening.
- Tighten the bushing screws only after the shaft has been inserted. (The bushing will be deformed if tightened without a shaft inserted.)
- Use a torque wrench to tighten the screws.
- Do not use screws other than those included.

Installation

(1)Wipe dusts off shaft surface and apply oil or grease. (Do not use any oil or grease containing molybdenum type wear reduction agents.)

(2)Wipe off and apply oil or grease on contact surfaces of spur gear and bushing. Apply oil or grease to thread and seat of screws as well.

(3)Temporarily assemble spur gear and bushing and insert the shaft. (Do not tighten the bushing before inserting the shaft.)

(4)After locating the gear on the shaft, tighten the clamping screws using a torque wrench in the diagonal pattern order, beginning lightly (approx. 1/4 of the prescribed tightening torque).

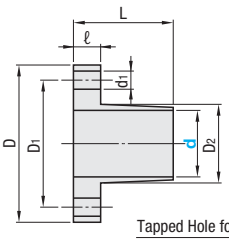
(5)Tighten the screws further to an increased torqu (approximately 1/2 specified torque).

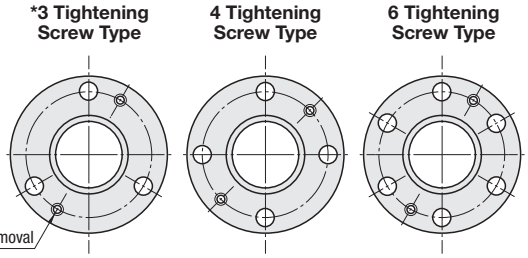
(6)Tighten to the prescribed full tightening torque.

(7)Finally, tighten the screws to the listed torque values in a circular order.

Removal

- Be sure to work after the system is completely shut down and stopped.
- Loosen the tightening screws in circular order.
- Insert screws into removal holes and tighten evenly.
- Repeat "Installation" process for re-installation.





Operation Temperature: –20~ +80°C * SH bushings have tapped holes for removal in 3 places. Material: Body 1.1191/C45E

- Shaft tolerance g6, shaft surface roughness Ra6.3 are standard.
- When there is a keyway machining or a D cut on the shaft, transmitting torque is reduced by approximately 15% or more.

Electroless nickel plating reduces maximum allowable torque and thrust load capacities by 20% - 30% .

Shaft Bore diameter 6.35 is available for Straight Bore and Straight Bore + Tap.
Shaft bore dia. 9 is not available for Keyway + Tap.
Select 10K as P dimension if you request keyway width of 4.0mm (height 1.8mm) for Keyway + Tap with shaft bore diameter of 10. P.1222
Combine the same handedness (L and L or R and R) for unparallel shafts and different handedness (L and R) for parallel shafts.
Helical gears generate axial thrust on shafts. Choose bearings that can withstand the axial thrust s generated by the gears.

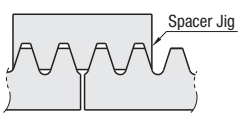
■How to connect Rack Gears (Both Ends Machined Type)

MISUMI rack gears (both ends machined type) are end machined with negative pitch tolerance in length. When connecting the racks, use a piece of rack as a spacer jig as shown below to properly adjust the pitch.



Rack Gears - L Dimension Configurable (One End Machined)

-Pressure Angle 20 Module 0.5 / 0.8 / 1.0 / 1.5 / 2.0 / 2.5 / 3.0-

Features: Configurable to desired lengths. One end is machined for connecting with other rack gears.

■Sprockets, Idler Sprockets

Shaft bores are machined on MISUMI Sprockets.
Idler sprockets with embedded bearings are also available in a wide variety.

Sprockets with shaft bore and keyway. Sizes 11B ~ 80B are available.	Sprocket which doesn't require machining to shafts. Easy phase matching. 35B and 40B are available.	Idler Sprockets for tension adjustments. Available in Steel, Stainless Steel and Nylon 6.	Bearings are embedded on both sides of general purpose sprockets. Suitable for adjusting tension on driving side.	Tooth-less Idler usable in space limited areas.

■Chains

A wide selection of Chains are offered for the purposes of both driving force transmission and transfer.

Roller Chains	
Standard Chains	Oilless Chains
P.1253~1259	P.1256~1258
	
The most widely used Roller Chains. Sizes 11B ~ 80B are available.	Roller Chains with special oil-impregnated bushing provides self-lubrication and reduced maintenance.

■Oil-free Chain Features

Twice longer pitches than those of general roller chains. Flat plate enables direct mount for transfer.	General Roller Chains come with Attachment, suitable for short distance transfer.	Pallets can be transferred at a speed of 2.5 times faster than chains. Suitable for Free Flow Conveyors.	Made with blocks smaller in width. Suitable for conveyance of small work pieces. Possible to convey pallets when used in parallel.	Work-pieces are directly placed on flat and wide plates to transfer. Suitable for accumulating transfers.

Note on Installation

- Tighten the bushing screws after inserting the shaft. (Bushing may deform if the screws are tightened before inserting the shaft.)
- Use torque wrench to tighten screws.
- Do not use tightening screws other than included.

Installation

(1) Wipe off the shaft surface and apply oil or grease. (Do not use any oil or grease containing molybdenum type elimination agent.)
(2) Please completely wipe off sprocket and bushing contact surfaces also before lubricating with oil or grease. Please lubricate screw and seating surfaces in the same manner.
(3) Subassemble sprocket and bushing before inserting into shaft. (Do not tighten the screws on the bushing before inserting into shaft)
(4) After locating, tighten the lock screws using a torque wrench in the diagonal line order, beginning lightly (approx. 1/4 of the predetermined tightening torque).
(5) Tighten the screws further to an increased torque (approximately 1/2 specified torque).
(6) Tighten with the predetermined tightening torque.
(7) Finally, tighten the screws to the listed torque values in a circumferential order.

Removal

- Be sure the system is completely shut down before starting work.
- Loosen the tightening screws in circumferential order.
- Insert a screw in a screw hole for removal and tighten evenly.
- Repeat "Installation" process for re-installation.

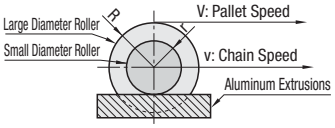
The Package of Chain

A roller chain longer than the unit length (unit number of links) is divided into separate packages per unit.
Ex. 1) :WCHE3-280, 2 separate packages: 160 links+120 links.
Ex. 2) :WCHE5-260, 3 separate packages: 96 linksx2+68 links.

Principle of the double speed chain



v: Chain Speed
V: Pallet Speed
r: Radius of Small Diameter Roller
R: Radius of Large Diameter Roller

When a chain runs at v speed, circumferential velocity of the small diameter roller is v. At this time circumferential velocity of the large diameter roller becomes (R/r) * v due to ratio of radius.
therefore, Pallet speed V becomes a value that chain speed V and (R/r) * v are combined.
V=(R/r) * v+v
=(R/r+1) * v
for ratio of radius of the large diameter and the small diameter roller is approximately 1.5:1.
V≈(1.5+1) * v
≈2.5v

When Using Idlers

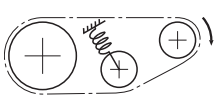
Chain elongation decreases transmission efficiency and accelerates wear, resulting in short life.
Adjustment mechanism is required for the following power transmission conditions.

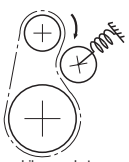
1.The center distance between shafts is long.
(In the case that the shaft center distance exceeds 30 to 50 times greater than used chain pitch, or 20 times or greater than chain pitch under pulsating loads)
2.Relative positioning of the two sprocket shafts is exactly, or nearly, perpendicular to each other.
3.Distance between both shaft centers is short, and the upper side is the chain's loose side.
4.The chain length is long on multi-shaft transmission.
5.The chain causes strong vibration.

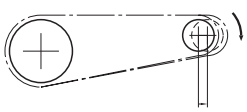
There are 2 ways to adjust for stretch of chain.

1.Installing an idler or a tensioner (when (1) the both sprocket shaft centers are fixed; (2) transmission is in vertical direction; or (3) the chain causes vibration)
2.Moving either of the shafts (It may be the easiest way for regular transmission applications)

(1) When both sprocket shaft centers are fixed (2) Vertical Transmission







Moving

Rollers or guide rails are used as idlers in very low speed operations while sprockets are commonly used for power transmitting chains. The idler should be installed on the chain's loose side span rather than on the tense side, except otherwise needed or in applications that require reversing operation. Installing the idler on the tension side unnecessarily increases the chain tension and makes its service life shorter. Ensure that No. of teeth of idler is designed so the idler does not exceed the max. allowable speed (Note when No. of teeth is smaller than a small sprocket, speed increases). At least 3 teeth of the idler should contact with chain. There are several ways of idler adjustment: 1.eccentric shaft system, 2. arm system, 3. sliding system. (Please also refer to "Chain Drive Mechanism"**P.1913**)

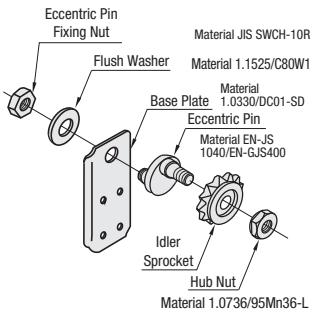
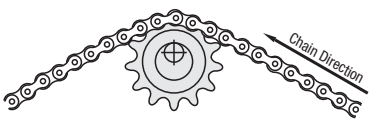
When adjusting tension at the chain driven side, refer to **P.1271**.



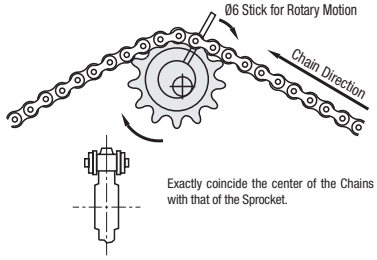
Tension Adjustment Method

By inserting a Ø6 rod in a hole of the eccentric pin and rotating, tension adjustment of max. 50mm can be obtained. Fix base plate so that idler and chain engage each other at a position of max. tension tolerance (Fig. 1), and tighten the eccentric pin nut in chain driving direction.

(Fig.1)

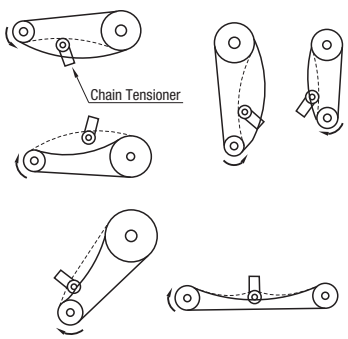


(Fig.2)



Chain Tensioner Position

Install a chain tensioner on the loose side as shown in the figure below.



(Note) Do not use the Chain Tensioner under the conditions where it is located on the side of adjusting tensions, such as forward reverse rotary drive.

P. 88

A Express Charge of 5,40 EUR is applied to 3 or more identical pieces.

Features:

Ultrahigh molecular weight polyethylene with excellent abrasion resistance is used for the guide part of the Chain Guide Tensioner. Force of built-in spring constantly maintains appropriate tension automatically, and enhance the performance and extend life without maintenance.

How to Install

Install by putting the guide onto the chain, firmly push until reaching a location where the tension stroke does not exceed 50% of that during empty load (40mm).
If necessary, adjust location by using shims or spacers.

Tension Adjusting Method (TSBXB)

For TSBXB, it is possible to adjust tension load in 3 stages by loosening the spring retention screw. During shipment, all 3 pieces of springs are not released. Loosen the center screw when required to release only one maintaining screw, loosen screws on both sides when 2 springs need to be released.
Provide enough free space below the retention screw to allow access for tension adjustments, after installation.
The springs can be returned to retained state by turning the retention screws while pressing the guide down.

* There is no spring retention screw in TSBXA.

■Types of Locating Pins for JigsII -Other Shapes / Surface Treatment-

Shape Product Name	Features	Shape Product Name	Features
 Detecting Pins (Sensor Embedded) (**P.1402**)	Pins with embedded sensors for detection of nut and positioning of work.	 Pedestal Pins (**P.1403**)	The pocket is to collect dust (spatter etc.) generated during welding. Best as locating pins for arc welding processes. Often used in automotive muffler welding applications.
 Detecting Pins (For Work Detecting Unit) (**P.1402**)	Pin diameter smaller than that of pilot hole on bottom of work and larger than that of inner diameter of nut enables detection of nuts.	 Locating Pin Holder for Jigs (**P.1404**)	Can be combined with a cylinder for applications where insertion and extraction of work is difficult. Two types that are with or without pins are available.
 Height Adjusting Pins (**P.1403**)	Flange thickness tolerance as good as ± 0.05 enables positioning both horizontal and height.	 Height Adjusting Washers (**P.1404**)	By using in combination with locating pins for jigs, vertical positioning is enabled. * Shoulder Thickness Tolerance ±0.05

■TiCN Treatment

TiCN treatment is a type of coating based on PVD method (physical vapor deposition).
TiCN coating excels in high hardness and wear resistance.
In addition, as it is processed in high vacuum with original temperature 500ºC or lower, when re-hardening temperature is over 500ºC, the hardness of basic material decreases, or thermal deformation and partial coating may occur.
MISUMI conducts consistent process flow from manufacture to coating and guarantees the dimensios and accuracies after coating.

■Features of TiCN Treatment

1. Wear Resistance
The surface hardness of TiCN coating is 3000HV and excellent in wear resistance.
2. Small Friction Coefficient
Friction coefficient of TiCN is small about 0.4μ and excellent in sliding property.

Dicoat® and TiCN Treatment are applied only on the head surface.
Strength class of TiCN coated threads is 8.8. Refer to **P.1959** for tightening torque.

■Dicoat® Treatment

This treatment provides a high surface hardness of 3200 to 3800HV using the vanadium carbide (VC) layer produced by the TD process.
TD Process Treatment and Sales, licensed at Toyota Central Research Institute, enables MISUMI a consistent process flow from manufacture of locating pin to TD process treatment, thus guaranteeing the precision of dimension.
Developed by Toyota Central Research Institute, a general research institution of the Toyota Group, the TD process is a "diffusion surface hardening method" that makes a specific element (carbide) diffusely penetrate metal to form a highly wear-resistant layer on the metal surface. Since put to practical use in 1970 by the Toyota Group, it has been widely used in surface press dies, die casting molds, cutting tools, jigs and machine parts.

■Features and Effects of Dicoat®

1. Wear Resistance
The vanadium carbide layer of 4 to 70m thick provides a surface hardness as high as 3200 to 3800HV and exhibits excellent wear resistance to almost all kinds of materials.
2. Toughness
Covering with vanadium carbide does not affect the toughness of the base material. Tempered at high temperature, the base material is so tough that it is not easily broken.

■Cautions for Use of Dicoat® Treated Products

Hardness of Dicoat® treated locating pins is high for its full portion, due to the nature of the treatment process. Compared to non-coated products, these are vulnerable to shock and may be broken if not tightened in a proper manner. Please take special care.

Do not tighten in a manner that applies abrupt shock to the product, such as tightening with an impact wrench or hammering the wrench during tightening.

Recommended Torque Chart

M	Torque (N/m)
6	7.8
8	19.1
10 (10T)	37.8

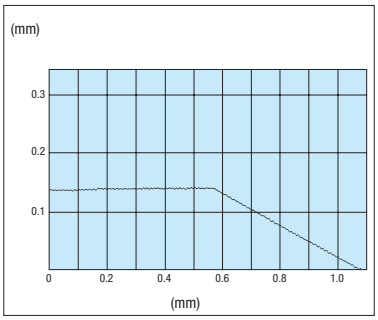
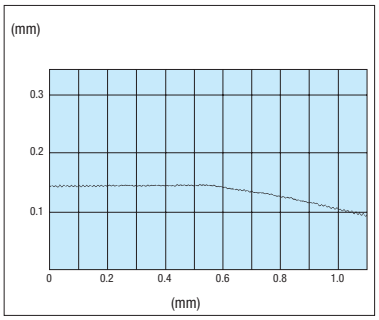
Measurement Results <Sample ⓐ>



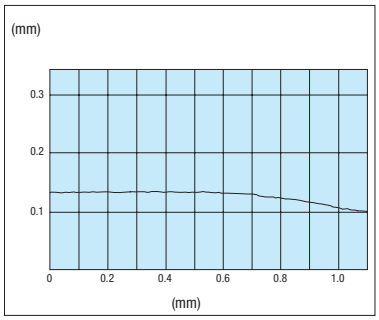
Conventional Tapered Type: The edge remains.

Measurement Results <Sample ⓑ>



Round Tapered Type: No edge.

Measurement Results <Sample ⓒ>



Buffed Product: No edge and the surface is smooth.

Locating Pins Large Head Round Tapered
-D and P Tolerance / Taper R Selectable-

Features: Small boundary between guide and locating parts ("No Edge" in diagram) prevents damage of locating target. Buff Finished Products with enhanced appearance and slide are also available.

■Feature

Since this type has a metal core, it is less prone to be broken when used for locating with sides.

Characteristic of resins P.2-859-860

- The D dimension tolerance is the result of measurement at room temperature (20°C).
